RESEARCH OVERVIEW / VERSION 1.0.0

Musical Structural Intelligence and Open-Ended Evolution (MSI-OEE)

From Musical UIERUs and Romantic Intelligence to Perspective Scoring, Structural Relay, and Human–AI Co-Evolution

CORE IDEA

Music can be studied not only as sequences of notes or generated audio, but as an evolving ecology of reusable structural intelligence units. MSI-OEE proposes a theory-first framework for discovering musical units, preserving or transforming their identities, composing them through structural relay, and evaluating outcomes across multiple human and AI perspectives.

SIX RESEARCH PILLARS

01 Musical UIERUs	Multi-scale units, dynamic boundaries, invariants, and context-dependent identity.
02 Structural Relay	Composition, transformation, soft contracts, and reusable musical structures.
03 Romantic Intelligence	Expressive and creative deviations that may reveal new aesthetic value.
04 Perspective Scoring	Composer, performer, listener, and collective perspectives with evaluation sovereignty.
05 Musical Distance + OTHERS	Similarity, unexplained residuals, counter-evidence, and responsible validation.
06 Human–AI Co-Evolution	Cross-subject aesthetic translation, intermediate units, and bidirectional learning.

PUBLICATION CONTENTS

8 research papers (MSI-001–008) · 3 cases (CASE-001–003) · 4 specifications (SPEC-001–004) · 7 planned figures (Fig-001–007) · Glossary, open questions, testable hypotheses, and validation roadmap.

EVIDENCE AND RESEARCH STATUS

Theory-first research release. The architecture and hypotheses are proposals, not demonstrated empirical results. The roadmap calls for baseline comparisons, conformance tests, counter-evidence, multi-perspective assessment, and independent replication. Musical similarity alone does not establish copying or legal infringement; functional AI preferences do not establish subjective experience.
